the amidated tripeptide Glp-Glu-Pro-NH2 (where Glp is pyroglutamic acid) is present in human semen; although the sequence reported here is consistent with an amino-terminally extended form derived from semenogelin, the sequence is followed in semenogelin by Trp, which (unlike Gly) probably cannot become the source of an amide moiety; the authors conclude the peptide must be derived from a closely related protein
                                                                                                                                                                                                    ##molecule_type protein

WT This abundant protein from seminal vesicle secretions maintains
gel-like environment for the sperm cells. At ejaculation,
kallikrein-like enzymes in prostatic secretions cleave this
protein, resulting in liquefaction of the seminal gel and
allowing increased sperm motility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          #region semenogelin short repeat 1\

                                                                                                                                                                                                                                                                                                      MEDLINE; 96225452.

ROBERTS R.G., FREEMAN T.C., KENDALL E., VETRIE D.L.P., DIXON A.K., SHAW-SMITH C., BONE Q., BOBROW M.;

"Characterization of DRP2, a novel human dystrophin homologue.";

NAT. GENET. 13:223-226(1996).

-!- FUNCTION: POSSIBLY INVOLVED IN MEMBRANE-CYTOSKELETON INTERACTIONS OF THE CENTRAL NERVOUS SYSTEM.

-!- TISSUE SPECIFICITY: BRAIN AND SPINAL CORD: VERY LOW LEVELS IN EYE, OVARY, EPIDLIDYMIS AND TESTIS: NOT IN CARRIAGE AND SKELETAL MUSCLE.

-!- SIMILARITY: IN OVERALL STRUCTURE TO DP116 DYSTROPHIN ISOFORM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

-!- FUNCTION: MYOSIN IS A PROTEIN THAT BINDS TO ACTIN AND HAS ATPASE
-ACTIVITY THAT IS ACTIVATED BY ACTIN.
-!- SUBJUNIT: HOMODIMER (POTEWITH).
-!- SIMILARITY: BELONGS TO CLASS-5 MYOSINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       L -> F (IN REF. 2).

NATL. ACAD. SCI. U.S.A. 82:4041-4044(1985).

-1- FUNCTION: SEMENOGELIN I IS THE PREDOMINANT PROTEIN IN HUMAN SEMEN.

IT PARTICIPATES IN THE FORMATION OF A GEL MATRIX ENTRAPPING THE
ACCESSORY GLAND SECRETIONS AND EJACULATED SPERMATOZOA. FRAGMENTS
OF SEMENOGELIN AND/ON FRAGMENTS OF THE RELATED PROTEINS MAY
CONTRIBUTE TO THE ACTIVATION OF PROGRESSIVE SPERM MOVEMENTS AS
THE GEL-FORMING PROTEINS ARE FRAGMENTED BY THE KALLIRREIN-LIKE
                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: ALPHA-INHIBIN-92 AND ALPHA-INHIBIN-31, DERIVED FROM THE PROTECLYTIC DEGRADATION OF SEMENOGELIN, INHIBIT THE SECRETION OF PITUITARY FOLLICLE-STIMULATING HORMONIT.
SUBUNIT: OCCURS IN DISCLEDE-LINKED COMPLEXES WHICH MAY ALSO CONTAIN TWO LESS ABUNDANT 71- AND 76-KD SEMENOGELIN-RELATED
         "Gene structure of semenogelin I and II. The predominant proteins in human semen are encoded by two homologous genes on chromosome 20."; J. BIOL. CHEM. 267:18080-18084(1992).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             42 AA REPEAT 1.

protein - protein database search, using Smith-Waterman algorithm MPsrch\_pp

Thu Oct 28 11:25:51 1999; MasPar time 4.17 Seconds 91.547 Million cell updates/sec Run on:

Tabular output not generated.

>US-09-081-707-10 (1-7) from US09081707 pep 45 Title: Description: Perfect Score: Sequence:

1 EHSSKLQ 7

179066 segs, 54579741 residues Searched:

PAM 150 Gap 15

Scoring table:

Post-processing: Minimum Match 08 Listing first 45 summaries

sptremb19 Database:

1:sp\_archea 2:sp\_bacteria 3:sp\_fungi 4:sp\_human 5:sp\_invertebrate 6:sp\_mammal 7:sp\_mhc 8:sp\_organelle 9:sp\_phage 10:sp\_plant 11:sp\_rodent 12:sp\_unclassified 13:sp\_vertebrate 14:sp\_virus

Mean 18.462; Variance 16.244; scale 1.136

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 14.672; Variance 35.519; scale 0.413 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

#### ALIGNMENTS

Claim 3; Fig 2C; 39pp; English.

Claim 3: Fig 2C; 39pp; English.

This is the full-length variable surface antigen VSAI protein of Enlichia canis. Its amino acid sequence was deduced from open reading frame (ORF) 1 of a genomic locus (see VO7180) of E. canis that was obtained on the basis of homology to the major antigenic protein MAPI (see W51088) of Cowdria ruminantium. This genomic locus included 2 ORFs encoding similar, but non-identical proteins (see W51096-97). A claimed composition comprises a nucleic acid see W51076-82) encoding a polypeptide (see W51088-99) that elicits a protective immune response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia, Ehrlichia, Anaplasma and Cowdria species. The Ehrlichia antigenic polypeptides can be used diagnostically to detect antibodies associated with Ehrlichia WPI: 98-251232/22. N-PSDB: V07180. Composition containing nucleic acid encoding rickettsial antigen -useful for, e.g. stimulating protective immune response in humans or W51096; 14-SEP-1998 (first entry) Ehrlichia canis VSA1 protein (partial sequence). MAP1 homologue; variable surface antigen; VSA1; rickettsia; \$2-APR-1998.) 17-6cT-1992. U19044. 17-0CT-1996. US-733230. (UYE.) UNIV FLORIDA. Oligopeptide(s) recognised and cleaved by free prostate specific antigen - useful in assays for active antigen, and in antigen - useful in assays for active antigen, and in proligopeptide-fug conjugates for prostatic cancer treatment bisclosure; Page 81; 192pp; English.

The present sequence is a novel oligopeptide that is recognised and concern treatment is an alor sperm entrapping gel protein. PSA, which has designed based on the sequences surrounding the PSA cleavage sites of semenogelin 1, a major sperm entrapping gel protein. PSA, which has confunctypsin-like specificity is responsible for dissolution of the gel structure formed at ejaculation by proteolysis of the major gel proteins (Semenogelin I and II, and fibronectin). Liquefaction of the ejaculate companies of psA are useful for monitoring treatment of adenocarcinoma measurements of PSA are useful for monitoring treatment of adenocarcinoma of the prostate. Prostate metastases are also known to secrete immunojdically reactive PSA since serum PSA is detectable at high levels in prostatectomised patients showing widespread metastatic prostate concer. Cytotoxic compounds that could be activated by the proteolytic cancer. Cytotoxic compounds that could be activated by the proteolytic of the PSA secreting energiases. Conjugates of cytotoxic compounds and this oligopeptide are useful in treatment of prostate cancer. The oligopeptide can also be useful in a quantitative assay for enzymatically activated by the proteolyte are useful in a quantitative assay for enzymatically activated by the proteolyte are useful in a quantitative assay for enzymatically activated by the proteolyte are useful and activated by the proteolyte are useful in a quantitative assay for enzymatically activated by the proteolyte are useful in a quantitative assay for enzymatically activate cancer.

WE peptide substrates cleaved by prostate-specific antigen - also cytotoxic conjugates for treating prostate cancer, and assay for determination of PSA activity.

Bisclosure: Page 60: 142pp; English.

Human semenogelin I (ASI) is one of the major proteins, including his including the sperm entrapping gel formed at cation of prostate specific antigen (PSA), a protease with chymotrypsin like specific antigen (PSA), a protease with chymotrypsin like specificity, which proteolyses the above major proteins. New substrates, including the present peptide, cleaved in assays to determine the proteolytic activity of free PSA in a sample, and to identify cpds. which inhibit the proteolytic activity of PSA, they may also be conjugated, via a covalent bond or prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide substrates cleaved by prostate-specific antigen - also cytotoxic conjugates for treating prostate cancer, and assay for determination of PSA activity.

C hSII and fibronectin, in the sperm entrapping gel formed at ejaculation. This gel structure undergoes dissolution via the action of prostate specific antigen (PSA), a protease with action of prostate specific antigen (PSA), a protease with proteins. New substrates, including the present peptide, cleaved by PSA, i.e. peptides contg. a hSI PSA cleavage site, can be used in assays to determine the proteolytic activity of FSA, they may also be conjugated, via a covalent bond
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; semenogelin I; sperm entrapping gel; ejaculation; protease; gel structure; dissolution; prostate specific antigen; proteolysis; chymotrypsin like specificity; peptide substrate; cleavage site; assay; determination; proteolytic activity; identification; inhibitor; cytotoxic agent; conjugated; treatment; prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              02-SEP-1996 (first entry)
Prostate specific antigen, semenogelin derived, cleavage substrate.

    PT Oligopeptide(s) recognised and cleaved by free prostate specific antigen - useful in assays for active antigen, and in oligopeptide-fug conjugates for prostatic cancer treatment claim 6; Page 162; 192pp; Branish.

Conforting of the sequences surrounding the pSA cleavage sites of proteolytically cleaved by free prostate specific antigen (PSA). It was designed based on the sequences surrounding the PSA cleavage sites of Semenogelin I, a major sperm entrapping gel protein. PSA, which has chymotrypsin-like specificity is responsible for dissolution of the gel structure formed at ejaculation by proteolysis of the major gel proteins (Semenogelin I and II, and fibronectin). Liquefaction of the ejaculate classes progressively motile spermatozoa. PSA complexed to alpha 1-antichymotrypsin is the predominant form of serum PSA. Serum measurements of PSA are useful for monitoring treatment of adenocarcinoma of the prostate. Prostate metastases are also known to secrete immunologically reactive PSA since serum PSA is detectable at high levels in prostatectomised patients showing widespread metastatic prostate cancer. Cytoroxic compounds that could be activated by the proteolytic cancer contrivity of PSA should also be prostate cell specific as well as specific activity of PSA should also be prostate cell specific as well as specific activity of PSA should also be prostate cell specific as well as specific activity of PSA should are useful in treatment of prostate cancer. The coligopeptide can also be used in a quantitative assay for enzymatically
                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

PT 01190peptide(s) recognised and cleaved by free prostate specific antigoner useful in assays for active antigen, and in antigen useful in assays for active antigen, and in antigen (by 192p). Brailsh.

Claim 3: Page 160, 192pp; English.

Claim 3: Page 160, 192pp; English.

Consequences surrounding the prostate specific antigen (PSA) cleavage sites of Semenogelin I, a major sperm entrapping gel protein. PSA, which has constructe formed at ejaculation by proteolysis of the major gel proteins of Semenogelin I and II, and fibronectin). Liquefaction of the gel structure formed at ejaculation by proteolysis of the major gel proteins of semenogelin I and II, and fibronectin). Liquefaction of the ejaculate concerns of a lantichymotrypsin is the predominant form of serum PSA. Serum massurements of PSA are useful for monitoring treatment of adenocarcinoma of the prostate. Prostate metastases are also known to secrete immunologically reactive PSA since serum PSA is detectable at high levels in prostatectomised patients showing widespread metastatic prostate cancer. Cytotoxic compounds that could be activated by the proteolytic activity of PSA secreting prostate metastases. Conjugates of cytotoxic compounds and this oligopeptide are useful in a quantitative assay for enzymatically are actived by the prostate collapperide can also be used in a quantitative assay for enzymatically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "this Ser is optionally attached via a peptide
bond to the 3'-amino group on the sugar ring of
doxorubicin, alternatively it is optionally
amidated when the peptide is N-terminally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          27-MAR.1998 (first entry)
Oligopeptide 15 cleaved by free prostate specific antigen.
Oligopeptide, proceolytic cleavage; prostate specific antigen;
Oligopeptide, proceolytic cleavage; prostate specific antigen; PSA;
cleavage site; Semenogelin I; chymotrypsin-like; serum PSA;
adenocarcinoma; prostate metastases; prostate cancer; treatment;
detection; cytotoxic conjugate; activation; quantitative assay.
cleavage site; Semenogelin I; chymotrypsin-like; serum PSA; adenocarcinoma; prostate metastases; prostate cancer; treatment; detection; cytotoxic conjugate; activation; quantitative assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "optionally N-terminally acetylated, when C-terminally amidated"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δ
                                                                                                                                                                                                                                                                                                                              Óλ
                                     Oligopeptide(s) recognised and cleaved by free prostate specific antigen - useful in assays for active antigen, and in antigen - useful in assays for active antigen, and in coligopeptide-fung conjugates for prostatic cancer treatment Claim 3 and 7 and 17: Page 160: 193pp: English.

Claim 3 and 7 and 17: Page 160: 193pp: English.

CC The present sequence is a novel oligopeptide that is recognised and conflict of sequences surrounding the PSA cleavage sites of Semenogelin I, a major sperm entrapping gel protein. PSA, which has of Semenogelin I, and or sperm entrapping gel protein. PSA, which has confortable in and II, and fibronectin). Liquefaction of the gel confortable in and II, and fibronectin). Liquefaction of the gel confortable in and II, and fibronectin). Liquefaction of the gel proteins of samenogelin I and II, and fibronectin). Liquefaction of the gel proteins of samenogelin I and II, and fibronectin). Liquefaction of the gel proteins of samenogelin I and indipersorate spermatozoa. PSA complexed to alpha 1-antichymotrypsin is the predominant form of serum PSA. Serum measurements of PSA are useful for monitoring treatment of adenocarcinoma of the prostate. Prostate metastases are also known to secrete immunologically reactive PSA should also be prostate cell specific as well as specific control and this oligopeptide are useful in treatment of prostate cancer. The collopopeptide are useful in treatment of prostate cancer. The collopopeptide and also be used in a quantitative assay for enzymatically active PSA. In a study of cleavage affinity, the TFA salt of this peptide the next and a disputed for the propertion of an also contained and a certained and experience of dispeted with enzymatically active PSA. After four hours 30 per cent of the hourshild also be asset.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Tototoxic conjugates for treating prostate cancer, and assay for determination of PSA activity

Claim 3: Page 108: 142pp: English.

Human semenogelin I (hSI) is one of the major proteins, including cancer and fibronectin. In the sperme entrapping get formed at cartion of prostate specific antigen (PSA), a protease with action of prostate specific antigen (PSA), a protease with action of prostate specificing, which proteologss the above major proteins. New substrates, including the present peptide, cleaved by PSA, i.e. peptides contg. a hSI PSA cleavage site, can be used in assays to determine the proteolytic activity of free PSA in a sample, and to identify of so, which inhibit the proteolytic activity of pSA, they may also be conjugated, via a covalent bond or peptide linker, to a cytotoxic agent and used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Prostate specific antigen, semenogelin derived, cleavage substrate. Human; semenogelin I; sperm entrapping gel; ejaculation; protease; gel structure; dissolution; prostate specific antigen; proteolysis; chymotrypsin like specificity; peptide substrate; cleavage site; assay; determination; proteolytic activity; identification; inhibitor; cytotoxic agent; conjugated; treatment; prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
chymotrypsin like specific antigen (PSA), a protease with chymotrypsin like specificantigen (PSA), a protease with chymotrypsin like specificatity, which proteolyses the above major proteins. New substrates, including the present peptide, cleaved by PSA, i.e. peptides contg a hSI PSA cleavage site, can be used in assays to determine the proteolytic activity of free PSA in a sample, and to identify cpds, which inhibit the proteolytic activity of PSA, they may also be conjugated, via a covalent bond or peptide linker, to a cytotoxic agent and used to treat the present peptide cleaved by YORK PSA after 4 hrs. was 30 % acylated and amidated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

T determination of psA activity

Glaim 3: Page 58: 142pp: English

Human semenogelin I (hSI) is one of the major proteins, including hSI and fibronectin, in the sperm entrapping gel formed at ejaculation. This gel structure undergoes dissolution via the action of prostate specificity, which proteolyses the above major chymotrypsin like specificity, which proteolyses the above major chymotrypsin like specificity, which proteolyses the above major chymotrypsin like specificity, which proteolyses the above major by PSA, i.e. peptides contg. a hSI PSA cleavage site, can be used in assays to determine the proteolytic activity of free PSA in a sample, and to identify cpds. which inhibit the proteolytic activity of PSA, they may also be conjugated, via a covalent bond or peptide linker, to a cytotoxic agent and used to treat proteoly present peptide cleaved by YORK PSA after 4 hrs. was 55 %.
                                                                                Prostate specific antign, semenogelin derived, cleavage substrate. Human; semenogelin I; sperm entrapping gel; ejaculation; protease; gel structure; dissolution; prostate specific antigen; proteolysis; chymotrypsin like specificity; peptide substrate; cleavage site; assay; determination; proteolytic activity; identification; inhibitor; cytotoxic agent; conjugated; treatment; prostate cancer.

The presult sequences is a nover consequence surrounding the prostate specific antigen (PSA) cleavage sites of Semenogelin I, a major sperm entrapping gel protein. PSA, which has conventive sortificity is responsible for dissolution of the gel structure formed at ejaculation by proteolysis of the major gel proteins of the major gel proteins structure formed at ejaculation by proteolysis of the major gel proteins (Semenogelin I and II, and fibronectin). Liquefaction of the ejaculate of the alpha I-antichymotrypsin is the predominant form of serum PSA. Serum measurements of PSA are useful for monitoring treatment of adenocarcinoma of the prostate. Prostate metastases are also known to secrete immunologically reactive PSA since serum PSA is detectable at high levels in prostatectomised patients showing widespread metastatic prostate cancer. Cytotoxic compounds that could be activated by the proteolytic or cancer. Cytotoxic compounds that could be activated by the proteolytic for PSA secreting prostate metastases. Conjugates of cytotoxic compounds and this oligopeptide are useful in treatment of prostate cancer. The oligopeptide can also be used in a quantitative assay for enzymatically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                              Claim 4; Page 111, 142pp; English.

Claim 4; Page 111, 142pp; English.

C Human semenogelin I (hSI) is one of the major proteins, including hSII and fibronectin, in the sperm entrapping gel formed at ejaculation. This gel structure undergoes dissolution via the action of prostate specific antigen (PSA), a protease with chymotrypsin like specificanty, which proteolyses the above major proteins. New substrates, including the present peptide, cleaved in assays to determine the proteolytic activity of free PSA in a sample, and to identify codes, which inhibit the proteolytic activity of PSA, they may also be conjugated, via a covalent bond or peptide linker, to a cytotoxic agent and used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   oligopeptide 132 based on Semenogelin I cleavage site. Oligopeptide; proteolytic cleavage; prostate specific antigen; PSA; cleavage site; Semenogelin I: chymotrypsin-like; serum PSA; adenocarcinoma; prostate metastases; prostate cancer; treatment; detection; cytotoxic conjugate; activation; quantitative assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               oligopeptide-drug conjugates for prostatic cancer treatment
Claim 4; Page 161; 192pp; English.
The present sequence is a novel oligopeptide designed based on the
New peptide substrates cleaved by prostate-specific antigen - algoritotoxic conjugates for treating prostate cancer, and assay for determination of PSA activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     oligopeptide(s) recognised and cleaved by free prostate specific antigen - useful in assays for active antigen, and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The properties of the prostatic cancer treatment of agencies for prostatic cancer treatment of agencies is a novel oligopeptide that is recognised and pisclosure; Page 102: 192pp; English.

The present sequence is a novel oligopeptide that is recognised and protein protein lyse agence is a novel oligopeptide that is recognised and protein protein protein protein PSA, which has designed based on the sequences surrounding the PSA cleavage sites of semenogalin I, a major specificity is responsible for dissolution of the gel structure formed at ejaculation by proteolysis of the major gel proteins (Semenogalin I and II, and fibronectin). Liquefaction of the ejaculate calcases progressively motile spermatozoa. PSA complexed to alpha I-antichymotrypsin is the predominant form of serum PSA. Serum measurements of PSA are useful for monitoring treatment of adenocarcinoma of the prostate. Prostate metastases are also known to secrete immunologically reactive PSA since serum PSA is detectable at high levels in prostatectomised patients showing widespread metastatic prostate cancer. Cytotoxic compounds that could be activated by the proteolytic activity of PSA should also be prostate cell specific as well as specific for PSA secreting prostate metastases. Conjugates of cytotoxic compounds and this oligopeptide are useful in treatment of prostate cancer. The oligopeptide are useful in treatment of prostate cancer. The oligopeptide was digested with enzymatically active PSA. After 4 hours 39 per cent of the peptide was cleaved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Oligopeptide 68 cleaved by free prostate specific antigen.
Oligopeptide, proteolytic cleavage, prostate specific antigen; PSA, cleavage site; Semenogelin I; chymotrypsin-like; serum PSA, adenocarcinoma; prostate metastases; prostate cancer; treatment; detection; cytotoxic conjugate; activation; quantitative assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    W33448 standard; Peptide; 10 AA.

with yor reason, we will be a seays for active antigen, and in an antigen useful in assays for active antigen, and in an antigen useful in assays for active antigen, and in antigen useful in assays for active antigen, and in antigen to ligopeptide-drug conjudates for prostatic cancer treatment claim 6; Page 162; 192pp; English.

Claim 6; Page 162; 192pp; English.

Claim 6; Page 162; 192pp; English.

CC proteolytically cleaved by free prostate specific antigen (PsA). It was designed based on the sequences surrounding the PsA cleavage sites of commorphin 1, a major sperm entrapping gel protein. PsA, which has composed in 1, and proposed protein protein protein of the gel criman and II, and fibronectin). Liquefaction of the ejaculate composes progressively metile spermatozoa. PsA complexed to alpha 1-antichymotrypsin is the predominant form of serum PsA. Serum measurements of PsA are useful for monitoring treatment of adenocarcinoma of the prostate. Prostate metastases are also known to secrete immunologically reactive PsA since serum PsA is detectable at high levels in prostatectomised patients showing widespread metastatic prostate compounds that could be activated by the proteolytic cancer, the prostate metastases. Conjugates of cyctoxic compounds and this oligopeptide are useful in treatment of prostate cancer. The concerned on a quantitative assay for enzymatically concerned and this oligopeptide and also be used in a quantitative assay for enzymatically concerned and the concerned in a quantitative assay for enzymatically concerned to the concerned of a concerned to the concerned to conce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "this Thr is optionally attached via a peptide
bond to the 3'-amino group on the sugar ring of
doxorubicin"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            w33429;
27-MAR-1998 (first entry)
Oligopeptide 9 cleaved by free prostate specific antigen.
Oligopeptide; proteolytic cleavage; prostate specific antigen; PSA;
cleavage site; Semenogelin I; chymotrypsin-like; serum PSA;
adenocarcinoma; prostate metastases; prostate cancer; treatment;
detection; cytotoxic conjugate; activation; quantitative assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            oligopeptide(s) recognised and cleaved by free prostate specific antigen - useful in assays for active antigen, and in oligopeptide-drug conjugates to prostatic cancer treatment claim 4 and 17; Page 161, 192pp; English.

```
The present sequence is a novel oligopeptide that is recognised and proteolytically cleaved by free prostate specific antigen (PSA). It was casing a based based on the sequences surrounding the PSA cleavage sites of Semenogelin I, a major sperm entrapping gel protein. PSA, which has consequent I, a major sperm entrapping gel protein. PSA, which the gel structure formed at ejaculation by proteolysis of the major gel proteins CS semenogelin I and II, and fibronectin). Liquefaction of the ejaculate creleases progressively motile spermatozoa. PSA complexed to alpha I-antichymotrypsin is the predominant form of serum PSA. Serum measurements of PSA are useful for monitoring treatment of adenocarcinoma of the prostate. Prostate metastases are also known to secrete immunologically reactive PSA since serum PSA is detectable at high levels of prostatectomised patients showing widespread metastatic prostate cancer. Cytotoxic compounds that could be activated by the proteolytic activity of PSA should also be prostate cell specific as well as specific of or PSA secreting prostate metastases. Conjugates of cytotoxic compounds and this oligopeptide are useful in treatment of prostate cancer. The citypeptide can also be used in a quantitative assay for enzymatically contine PSA. In a study of cleavage affinity, the TFA salt of this peptide was cleaved.

Sequence 10 AA;

been proven the andated tripeptide Glp-Glu-Pro-NH2 (where Glp is pyroglutamic acid) is present in human semen; although the sequence reported here is consistent with an amino-terminally extended form derived from semenogelin, the sequence is followed in semenogelin by Trp, which. (unlike Gly) probably cannot become the source of an amide moiety; the authors conclude the peptide must be derived from a closely related protein

Apundant protein from seminal vesicle secretions maintains
gel-like environment for the sperm cells. At ejaculation,
kallikrain-like enaymes in prostatic secretions cleave this
protein, resulting in liquefaction of the seminal gel and
allowing increased sperm motility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isolation and characterization of the major gel proteins human semen, semenogelin I and semenogelin II. 568761
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              #product seminal basic protein #status experimental

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 20.894; Variance 18.348; scale 1.139

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. Mean 20.112; Variance 21.027; scale 0.956
